Genome project tables in the genomes package

Chris Stubben

September 4, 2014

The `genomes` package collects genome project metadata from NCBI using E-utility scripts (esearch, esummary, efetch and elink) or the NCBI genomes FTP. The packages also includes tools to summarize, compare and plot the data in the R programming environment. Genome tables are a defined class (*genomes*) and each table is a data frame where rows are genome projects and columns are the fields describing the associated metadata. A number of methods are available that operate on genome tables including `print`, `summary`, `plot` and `update`.

Genome tables from the Genomes FTP at NCBI include prokaryotic (`proks`), eukaryotic (`euks`) and virus genomes (`virus`). The `print` methods displays the first few rows and columns of the table (either select less than seven rows or convert the object to a `data.frame` to print all columns). The `summary` function displays the download date, a count of projects by status, and a list of recent submissions. The `plot` method displays a cumulative plot of genomes by release date.

```
R> data(proks)
R> proks
```

```
  A genomes data.frame with 27570 rows and 25 columns

         pid                                    name             status
1      33011     Abiotrophia defectiva ATCC 49176           Scaffold
2     174970     Acaricomes phytoseiuli DSM 14247             Contig
3      12997       Acaryochloris marina MBIC11017 Gapless Chromosome

R> summary(proks)

$`Total genomes`
[1] 27570 genome projects on Sep 04, 2014

$`By status`
                     Total
Contig               13074
Scaffold             10718
Gapless Chromosome    3053
Chromosome             373
Chromosome with gaps   343
Complete                 9

$`Recent submissions`
  released   name                        status
1 2014-09-02 Altuibacter lentus          Scaffold
2 2014-09-02 Bacillus cereus ATCC 4342   Scaffold
3 2014-09-02 Bacillus licheniformis      Scaffold
4 2014-09-02 Bacillus megaterium         Scaffold
5 2014-09-02 Paenibacillus macerans      Scaffold

R> plot(proks, log='y', las=1)
R>
```

Most importantly, the `update` method downloads the latest version of the table from NCBI and displays a message listing the number of project IDs added and removed (not run).

```
R> update(proks)
```

A number of additional functions assist in selecting, sorting and grouping genomes. The `species` and `genus` functions can be used to extract the species or genus from a scientific name. The `month` and `year` functions can be used to extract the month or year from the release date. The `table2` function formats and sorts a contingency table by counts.

```
R> spp<-species(proks$name)
R> table2(spp)
```

```
                          Total
Staphylococcus aureus      4178
Escherichia coli           2292
Mycobacterium tuberculosis 1765
Salmonella enterica         907
Acinetobacter baumannii     816
Helicobacter pylori         432
Klebsiella pneumoniae       386
Enterococcus faecalis       352
Streptococcus agalactiae    308
Streptococcus pneumoniae    297
```

Because subsets of tables are often needed, the binary operator `like` allows pattern matching using wildcards. The `plotby` function can then be used to plot the release dates by status using labeled points, in this case to identify complete and draft sequences of *Yersinia pestis* released before 2012 (Figure 1).

```
R> ## Yersinia pestis
R> yp<-subset(proks, name %like% 'Yersinia pestis*' & year(released)<2012 )
R> plotby(yp, labels=TRUE, cex=.5, lbty='n', curdate=FALSE)
R>
```

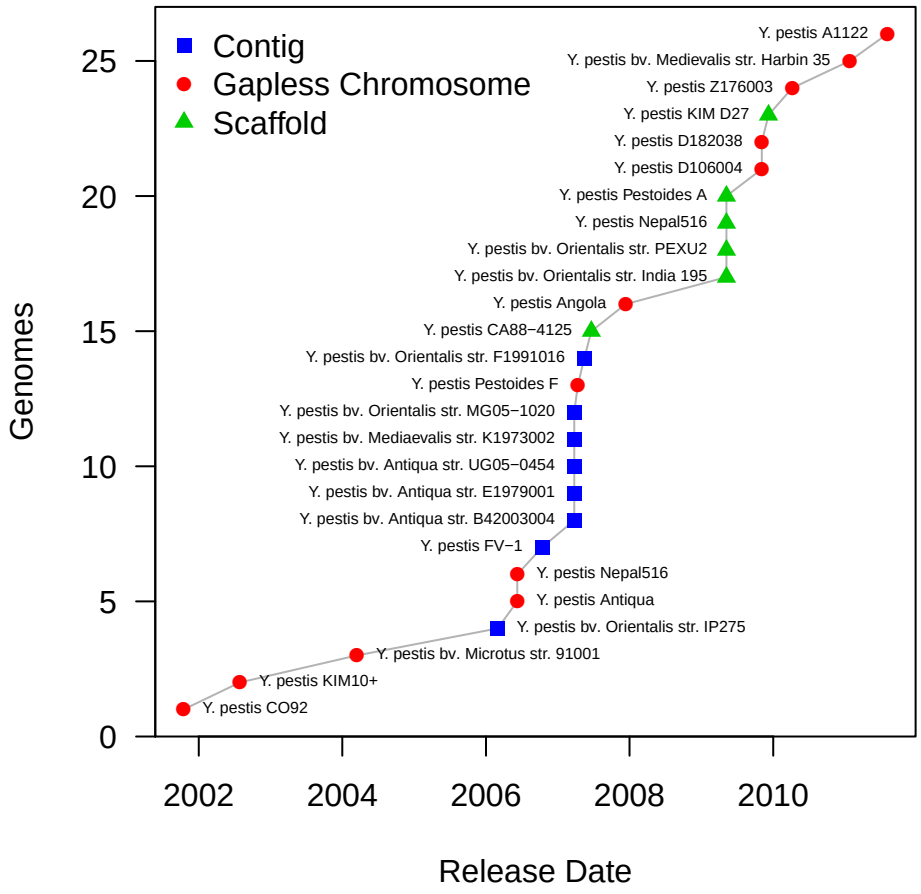

Figure 1: Cumulative plot of *Yersinia pestis* genomes released before 2012.
